

## Monday Maths 1 Star

Draw a table like the one below, using a ruler to complete your Maths today.

Item	Estimate	Actual Amount	Difference
4 Pints of Milk			
Punnet of Strawberries			
32" Television			
Bunk Bed			

Write in your estimates and then look at the attached sheet for the Actual Amounts.

Now you have filled in the actual amounts have a go at working out the difference between your estimate and the actual cost.

To do this find the largest number of the 2 amounts and subtract it from the smaller one.

For example: If I thought a dozen eggs cost £3.50 and the actual amount was £2.40 the calculation I would do is:

$$£3.50 - £2.40$$

I could convert this into p as I know 100p is in a £ - so  
 $350p - 240p = 110p$  or £1.10

Which amount was cheaper the estimate or the actual amount?
